Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

10/698,039

Applicant(s)

USUDA, HIDENORI

Examiner

Geoffrey Mruk

Art Unit

2853

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 02 June 2006.
2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-26 is/are pending in the application.
4a) Of the above claim(s) _____ is/are withdrawn from consideration.
5) ☐ Claim(s) _____ is/are allowed.
6) ☒ Claim(s) 1-26 is/are rejected.
7) ☐ Claim(s) _____ is/are objected to.
8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
10) ☒ The drawing(s) filed on 30 October 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____.
4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____.
5) ☐ Notice of Informal Patent Application (PTO-152)
6) ☐ Other: _____.

DETAILED ACTION

Claim Objections

Claim 1 is objected to because of the following informalities: Claim 1 recites method steps in an apparatus claim. Claims directed to an apparatus are distinguished from the prior art in terms of structure rather than function (MPEP 2114). Therefore, for examination purposes, the examiner will examine all the structural limitations of claim 1. Appropriate correction is required.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

1. Claims 1-7 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Toye (US 4,068,144) in view of Arakawa et al. (US 6,270,180 B1), and in further view of Hertz et al. (US 4,050,075).

With respect to claim 1, the primary reference of Toye discloses a droplet discharging apparatus (Fig. 1) comprising means for discharging a discharge liquid in the form of droplets through an aperture (Fig. 1, element 18) by mechanically deforming a piezoelectric element (Fig. 1, elements 10-12) wherein the driving waveform frequency is from 20kHz to 90kHz (i.e. an ultrasonic band; Column 4, lines 34-67;

Art Unit: 2853

Column 5, lines 1-17) and “In an ink jet printer transport system, an ink jet gun projects charged ink droplets which are deflected to form an information pattern on a moving document surface. When the transport velocity changes, it is necessary to provide a corresponding change in the drop rate” (Column 1, lines 22-25).

However, Toye fails to disclose:

- a piezoelectric element which is subjected to a heating drive signal of a repetitive frequency when the aperture is positioned in an image forming region, where the heating drive signal is insufficient to cause droplets from being discharged through the aperture thereby facilitating heating of the droplets; wherein the normal drive signal and the heating drive signal are both generated by a single waveform generating section,
- controlling an X-direction drive motor that moves the aperture in an X-direction and a Y-direction- drive motor that moves the aperture in a Y-direction using an arithmetic control section in receipt of setting information generated by a control computer;
- generating drive signals using the waveform generating section based on drive signal data generated by the arithmetic control section, the waveform generating section generates a plurality of drive signals of predetermined shapes, including the normal drive signal and the heating drive signal;
- outputting the drive signals to a switching circuit; and

- generating selection data using the arithmetic control section and outputting the selection data to a switching signal generator, the selection data designates the drive signal to be applied to the piezoelectric element and
- the discharge ink is a printing ink, as required in the instant claims.

The secondary reference of Arakawa discloses a piezoelectric element (Fig. 4, element 17p) which is subjected to a heating drive signal of a repetitive frequency (Fig. 8b, element T2), the heating drive signal being insufficient to cause droplets from being discharged through the aperture thereby facilitating heating of the droplets (Column 11, lines 39-63), where "it is preferable that the frequency of the heating waveform is $2f \pm 50\%$, wherein f is a frequency of driving waveform" (Column 15, 30-35); wherein the normal drive signal and the heating drive signal are both generated by a single waveform generating section (Fig. 1, element 15; Column 11, lines 35-38).

With respect to claim 2, the secondary reference of Arakawa discloses the heating drive signal is applied to the piezoelectric element immediately before a droplet is discharged by the normal drive signal (Fig. 8e).

With respect to claim 3, the secondary reference of Arakawa discloses the heating drive signal is applied to the piezoelectric element while a droplet is being discharged by the normal drive signal (Column 15, lines 19-27).

With respect to claim 4, the secondary reference of Arakawa discloses the heating drive signal is applied to the piezoelectric element if the temperature of a discharge liquid that is detected by a temperature detecting means drops below a predetermined threshold temperature (Column 9, lines 11-30).

With respect to claim 5, the secondary reference of Arakawa discloses the repetitive frequency of the heating drive signal is 40 kHz or more (Column 15, 30-35).

With respect to claim 6, the secondary reference of Arakawa discloses the amplitude of the heating drive signal is half that or less of the normal drive signal (Column 15, 30-35).

With respect to claim 7, the secondary reference of Arakawa discloses the discharge liquid is a printing ink (Column 6, lines 61-67).

With respect to claim 13, the secondary reference of Arakawa discloses the heating drive signal is applied to the piezoelectric element before, during and after preliminary discharging (Column 15, lines 19-40).

The tertiary reference of Hertz discloses an ink jet method an apparatus where "According to one aspect of this invention there is provided apparatus for X-Y plotting and for making drawings which comprises in combination ink-jet writing means affixed to a traveling carriage, means to sense a function (e.g., velocity or acceleration) of the relative movement between a receptor on which the ink-jet is writing and the carriage on which the ink-jet apparatus is mounted and means to employ that function in the form of a corrective signal to the ink-jet apparatus to control the flow and/or disposition of the ink to maintain a predetermined line width in the plot or drawing" (Column 2, lines 44-54) and "Relative movement between the carriage and receptor may be realized by moving the carriage in both the X- and Y-directions, or by moving the carriage in one of these directions and the receptor in the other. The means of this invention for

maintaining predetermined line widths in X-Y plots and mechanical drawings are applicable to all of the known types of ink-jet apparatus" (Column 2, lines 62-67).

At the time of the invention, it would have been obvious to one of ordinary skill in the art to use the heat drive signal disclosed by Arakawa in the inkjet printer of Toye for the purpose of "heating is conducted by the heating signal whose frequency is controlled for each head, it is not necessary to provide any outside fitting part for heating near each head, thereby, a bad influence onto the image, caused by the change of the ink viscosity due to the temperature, can be avoided" (Column 17, lines 50-62) and to use the relative movement between the carriage and receptor disclosed by Hertz in the inkjet printer of Toye "to provide apparatus of the character described which is operated and controlled by electrical signals from a computer or other appropriate source and which is capable of producing lines of highly uniform widths. Still another object of this invention is to provide a plotting and/or drafting apparatus, which is rapid, accurate and readily controlled" (Column 2, lines 24-32).

2. Claims 8-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Toye (US 4,068,144) in view of Arakawa et al. (US 6,270,180 B1), and Hertz et al. (US 4,050,075) as applied to claims 1-7 above, and further in view of Speakman (US 6,503,831 B2).

Toye, Arakawa, and Hertz references disclose all of the limitations of the droplet discharging apparatus except

- the discharge liquid is an electrically conductive material for forming a wiring pattern,

- the discharge liquid is a transparent resin for forming a microlens,
- the discharge liquid is a resin for forming a color layer of a color filter,
- the discharge liquid is an electro-optic material,
- the electro-optic material is a fluorescent organic compound presenting electroluminescence.

Speakman discloses suitable deposition materials using drop on demand printing (Column 44, lines 30-67 and Column 45, lines 1-42), where

- the discharge liquid is an electrically conductive material for forming a wiring pattern (Column 44, lines 30-37),
- the discharge liquid is a transparent resin for forming a microlens (Column 35, lines 8-15),
- the discharge liquid is a resin for forming a color layer of a color filter (Column 35, lines 8-15),
- the discharge liquid is an electro-optic material (Column 2, lines 4-34),
- the electro-optic material is a fluorescent organic compound presenting electroluminescence (Column 44, lines 30-59).

At the time of the invention, it would have been obvious to one of ordinary skill in the art to use the deposition materials disclosed by Speakman in the inkjet printer of Toye. The motivation for doing so would have been "covering hitherto unexplored ideas that will be fuelled by the high degree of processing flexibility that is provided by ink jet printing in electronic, opto-electronic, and optical device manufacture" (Column 2, lines 4-34).

3. Claims 14-20 and 26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Toye (US 4,068,144) in view of Arakawa et al. (US 6,270,180 B1), and in further view of Hertz et al. (US 4,050,075).

With respect to claim 14, the primary reference of Toye discloses a droplet discharging method comprising discharging a discharge liquid in the form of droplets through an aperture (Fig. 1, element 18) by mechanically deforming a piezoelectric element (Fig. 1, elements 10-12) wherein the driving waveform frequency is from 20kHz to 90kHz (i.e. an ultrasonic band; Column 4, lines 34-67; Column 5, lines 1-17)) and "In an ink jet printer transport system, an ink jet gun projects charged ink droplets which are deflected to form an information pattern on a moving document surface. When the transport velocity changes, it is necessary to provide a corresponding change in the drop rate" (Column 1, lines 22-25).

However, Toye fails to disclose:

- a piezoelectric element which is subjected to a heating drive signal of a repetitive frequency when the aperture is positioned in an image forming region, where the heating drive signal is insufficient to cause droplets from being discharged through the aperture thereby facilitating heating of the droplets; wherein the normal drive signal and the heating drive signal are both generated by a single waveform generating section,
- controlling an X-direction drive motor that moves the aperture in an X-direction and a Y-direction- drive motor that moves the aperture in a Y-direction using an

arithmetic control section in receipt of setting information generated by a control computer;

- generating drive signals using the waveform generating section based on drive signal data generated by the arithmetic control section, the waveform generating section generates a plurality of drive signals of predetermined shapes, including the normal drive signal and the heating drive signal;
- outputting the drive signals to a switching circuit; and
- generating selection data using the arithmetic control section and outputting the selection data to a switching signal generator, the selection data designates the drive signal to be applied to the piezoelectric element and
- the discharge ink is a printing ink, as required in the instant claims.

The secondary reference of Arakawa discloses the discharge liquid is heated by subjecting the piezoelectric element (Fig. 4, element 17p) to heating drive signal at a repetitive frequency (Fig. 8b, element T2), the heating drive signal being insufficient to cause the discharge liquid from being discharged through the aperture thereby facilitating heating of the droplets (Column 11, lines 39-63), where "it is preferable that the frequency of the heating waveform is $2f \pm 50\%$, wherein f is a frequency of driving waveform" (Column 15, 30-35) and wherein the normal drive signal and the heating drive signal are both generated by a single waveform generating section (Fig. 1, element 15; Column 11, lines 35-38).

With respect to claim 15, the secondary reference of Arakawa discloses the heating drive is carried out immediately before the normal drive for discharging a droplet (Fig. 8e).

With respect to claim 16, the secondary reference of Arakawa discloses wherein the heating drive is carried out during the normal drive (Column 15, lines 19-27).

With respect to claim 17, the secondary reference of Arakawa discloses wherein the heating drive is carried out if the temperature of a discharge liquid drops below a predetermined threshold temperature (Column 9, lines 11-30).

With respect to claim 18, the secondary reference of Arakawa discloses wherein the repetitive frequency of the heating drive is 40 kHz or more (Column 15, 30-35).

With respect to claim 19, the secondary reference of Arakawa discloses wherein the heating drive is carried out at an amplitude that is half that or less of the normal drive (Column 15, 30-35).

With respect to claim 20, the secondary reference of Arakawa discloses the discharge liquid is a printing ink (Column 6, lines 61-67).

With respect to claim 26, the secondary reference of Arakawa discloses the heating drive signal is applied to the piezoelectric element before, during and after preliminary discharging (Column 15, lines 19-40).

The tertiary reference of Hertz discloses an ink jet method an apparatus where "According to one aspect of this invention there is provided apparatus for X-Y plotting and for making drawings which comprises in combination ink-jet writing means affixed to a traveling carriage, means to sense a function (e.g., velocity or acceleration) of the

relative movement between a receptor on which the ink-jet is writing and the carriage on which the ink-jet apparatus is mounted and means to employ that function in the form of a corrective signal to the ink-jet apparatus to control the flow and/or disposition of the ink to maintain a predetermined line width in the plot or drawing" (Column 2, lines 44-54) and "Relative movement between the carriage and receptor may be realized by moving the carriage in both the X- and Y-directions, or by moving the carriage in one of these directions and the receptor in the other. The means of this invention for maintaining predetermined line widths in X-Y plots and mechanical drawings are applicable to all of the known types of ink-jet apparatus" (Column 2, lines 62-67).

At the time of the invention, it would have been obvious to one of ordinary skill in the art to use the heat drive signal disclosed by Arakawa in the inkjet printer of Toye for the purpose of "heating is conducted by the heating signal whose frequency is controlled for each head, it is not necessary to provide any outside fitting part for heating near each head, thereby, a bad influence onto the image, caused by the change of the ink viscosity due to the temperature, can be avoided" (Column 17, lines 50-62) and to use the relative movement between the carriage and receptor disclosed by Hertz in the inkjet printer of Toye "to provide apparatus of the character described which is operated and controlled by electrical signals from a computer or other appropriate source and which is capable of producing lines of highly uniform widths. Still another object of this invention is to provide a plotting and/or drafting apparatus, which is rapid, accurate and readily controlled" (Column 2, lines 24-32).

Art Unit: 2853

4. Claims 21-25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Toye (US 4,068,144) in view of Arakawa et al. (US 6,270,180 B1), and Hertz et al. (US 4,050,075) as applied to claims 14-20 above, and further in view of Speakman (US 6,503,831 B2).

Toye, Arakawa, and Hertz references disclose all of the limitations of the droplet discharging apparatus except

- the discharge liquid is an electrically conductive material for forming a wiring pattern,
- the discharge liquid is a transparent resin for forming a microlens,
- the discharge liquid is a resin for forming a color layer of a color filter,
- the discharge liquid is an electro-optic material,
- the electro-optic material is a fluorescent organic compound presenting electroluminescence.

Speakman discloses suitable deposition materials using drop on demand printing (Column 44, lines 30-67 and Column 45, lines 1-42), where

- the discharge liquid is an electrically conductive material for forming a wiring pattern (Column 44, lines 30-37),
- the discharge liquid is a transparent resin for forming a microlens (Column 35, lines 8-15),
- the discharge liquid is a resin for forming a color layer of a color filter (Column 35, lines 8-15),
- the discharge liquid is an electro-optic material (Column 2, lines 4-34),

- the electro-optic material is a fluorescent organic compound presenting electroluminescence (Column 44, lines 30-59).

At the time of the invention, it would have been obvious to one of ordinary skill in the art to use the deposition materials disclosed by Speakman in the inkjet printer of Toye. The motivation for doing so would have been "covering hitherto unexplored ideas that will be fuelled by the high degree of processing flexibility that is provided by ink jet printing in electronic, opto-electronic, and optical device manufacture" (Column 2, lines 4-34).

Response to Arguments

Applicant's arguments filed 2 June 2006 have been fully considered but they are not persuasive. Applicant's arguments with respect to claims 1 and 14 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not

mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Geoffrey Mruk whose telephone number is 571 272-2810. The examiner can normally be reached on 7am - 330pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Stephen Meier can be reached on 571 272-2149. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
